AAY25600 RESULT

(first entry)

30-SEP-1999

AAY25600;

This invention describes a novel method of desensitizing a patient to a polypeptide allergen and comprises administering to the patient a peptide derived from the allergen where restriction to a MrC class II molecule possessed by the patient can be demonstrated for the peptide and the peptide is able to induce a late phase response in an individual who possesses the MrC class II molecule. The methods can be used for desensitising patients to allergens present in e.g. grass, tree and weed (including ragweed) pollens, fungi and moulds, foods, stinging insects, the chiromidae (non-biting midges), spiders and mites, housefly, fruit Major histocompatibility complex; class II; desensitising; human; allergen; grass; tree; weed; pollen; fungi; mould; food; insect; sting; chiromidae; spider; mite; housefly; fruit fly; sheep blow fly; honeybee; screw worm fly; grain weevil; slikworm; bee moth; larvae; mealworm; cat; cockroach; beetle; dog; horse; cow; pig; sheep; rabbit; rat; guinea pig; mice; gerbil; vaccine; treatment; prevention; hypersensitivity. to allow desensitisation to one or more polypeptide antigens. The method of the invention has immunomodulator activity, and may have a use in gene therapy. The composition and method are useful in manufacturing a medicament for desensitising an individual to a selected polypeptide antigen or for generating in the individual a state of Myporesponsiveness to the antigen to allow desensitisation to one or more polypeptide antigens. The present sequence is used in the exemplification of the

Sequence 97 AA;

The invention relates to a novel method for desensitising an individual to a selected polypeptide antigen. The method comprises administering a composition that contains polypeptide antigens in amount that generates in the individual a state of hyporesponsiveness to the antigen

```
The present invention describes an isolated nucleic acid molecule (I)

comprising a polynucleotide or its conservatively modified variant having

a sequence of 291 bp (SRQ ID NO:1 (S1), AbJ65665). Also described: (I) a

recombinant expression cassette (II) comprising (I); (2) a vector (III)

comprising (II); (3) a host cell comprising (III); (4) a group 2/3 (III)

comprising (II); (4) a host cell comprising (III); (4) a group 2/3 (III)

comprising (II); (5) a host cell comprising (III); (4) a group 2/3 (III)

comprising (II); (5) a host cell comprising (III); (4) a group 2/3 (III)

comprising the code of the comprising (III); (7) a method of modifying (6) an antibody that selectively binds to (IV); (7) a method of modifying cell walls in the tissues of a transgenic plant, comprising introducing (II); (6) a method of modifying cell appropriate of a transgenic plant, comprising introducing the mechanical strength of cellulose fibres; (8) a method of weakening the mechanical strength of cellulose fibres; (9) a method of cell comprising a nucleic acid that comprises SI and that comprises SI and that a genome comprising a nucleic acid that comprises SI and that comprising an expression cassette operably linked to a group 2/3 allergen

cell comprising a cutivity, or a transgenic plant comprises SI and that comprises SI and that contains and (12) seeds of the plant described above, which carry the conditions; and (12) seeds of the plant described above, which carry the

New isolated nucleic acid molecules encoding polypeptides having expansin activity, useful for altering plant cell wall properties to effect growth, flexibility and mechanical strength in tissues in which they are expressed,

Disclosure; SEQ ID NO 4; 73pp; English.

The present invention describes an isolated nucleic acid molecule (I) comprising a polynucleotide or its conservatively modified variant having a sequence of 291 bp (SED, No. (SI), ADG5665). Also described: (I) a recombinant expression cassette (II) comprising (I); (2) a vector (III) comprising (II); (4) a group 2/3 albergen encoding a polypeptide comprising (III); (4) a group 2/3 albergen encoding a polypeptide comprising any of the 12 sequences of 90-100 amino acids given in SEQ ID NO:2, or SEQ ID NO:8 to 18 (ADJ6566, or ADJ65072 to ADJ65082); (5) an isolated polypeptide (IV) encoded by (I); (6) an antibody that selectively binds to (IV); (7) a method of modifying cell walls in the tissues of a transgenic plant, comprising introducing into a plant an expression cassette comprising a promoter active in cells of plants operably linked to a group 2/3 allergen polymucleotide which

weakening the mechanical strength of cellulose fibres; (9) a method for producing a polypeptide having expansin activity; (10) a transgenic plant cell comprising a nucleic acid that comprises S1; (11) a transgenic plant ö with a genome comprising a nucleic acid that comprises S1 and that possesses expansin activity, or a transgenic plant comprising an expression cassette operably linked to a group 2/3 allergen polymucleotide which specifically hybridises to S1 under stringent conditions; and (12) seeds of the plant described above, which carry the DNA construct in their genome. (I) has plant growth regulant activity, and can be used in gene therapy. The composition and methods of the present invention can be used in altering plant cell wall properties, which may effect growth, flexibility and mechanical strength in tissues in which they are expressed. The present sequence represents a modified variant ryegrass Lol p 3 allergen protein sequence, which is used in the exemplification of the present invention. method (8) specifically hybridises to S1 under stringent conditions;

New isolated nucleic acid molecules encoding polypeptides having expansin activity, useful for altering plant cell wall properties to effect growth, flexibility and mechanical strength in tissues in which they are expressed

建工新艺

Claim 6; SEQ ID NO 18; 73pp; English.

The present invention describes an isolated nucleic acid molecule (I) comprising a polynucleotide or its conservatively modified variant having comprising a polynucleotide or its conservatively modified variant having comprising (II); (2) a sequence of 291 bp (SEQ ID NO: 41); (2) a vector (III) comprising (II); (4) a group 2/3 alegan encoding a polypeptide comprising (III); (4) a group 2/3 conference of 201 begins no acids given in SEQ ID NO:2, or SEQ ID NO:8 to 18 (ADD5066, or ADD55072 to ADJ55082); (5) an isolated polypeptide (IV) encoded by (I); (6) an antibody that selectively binds to (IV); (7) a method of modifying cell walls in the tissues of a transgenic plant; comprising introducing into a plant an expression cassette comprising a promoter active in cells of plants operably linked to a group 2/3 allergen polymucleotide which specifically hybridises to S1 under stringent conditions; (8) a method of specifically hybridises to S1 under stringent conditions; (8) a method of cell comprising a pucleic acid that comprises S1 and that cell comprising a nucleic acid that comprises S1 and that the agenome comprising a nucleic acid that comprises S1 and that comprises essent and (12) seeds of the plant described above, which carringent conditions; and (12) seeds of the plant described above, which carringent conditions; and (12) seeds of the plant described above, which carringent conditions, and (12) seeds of the plant described above, which may effect growth, flexibility and mechanical strength in tissues, which may effect growth, flexibility and mechanical strength in tissues, in which heave are expressed. The present invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                               ઠ
                                                                                                                                                                                                                                                                      This invention describes a novel method of desensitizing a patient to a polypeptide allergen and comprises administering to the patient a peptide derived from the allergen where restriction to a MHC Class II molecule cossessed by the patient can be demonstrated for the peptide and the peptide is able to induce a late phase response in an individual who peptide is able to induce a late phase response in an individual who cossesses the MHC class II molecule. The methods can be used for desensitising patients to allergens present in e.g. grass, tree and weed (including ragweed) pollens, fungi and moulds, foods, stinging insects, the chiromidae (non-biting midges), spiders and mites, housefly, fruit to consist the performance of a parvae, bee moth larvae, mealworm, cockroach, larvae of consisting midge larvae, bee moth larvae, mealworm, cockroach, larvae of the chiromidge larvae, bee moth larvae, mealworm, cockroach, larvae of sheep, rabbit, rat, guinea pig, mice or gerbil. They can also be used to produce immunological vaccines which may be used to prevent and/or treat conditions involving hypersensitivity to allergens. This sequence

The invention relates to a novel method for desensitising an individual to a selected polypeptide antigen. The method comprises administering a composition that contains polypeptide antigens in an amount that generates in the individual a state of hyporesponsiveness to the antigen to allow desensitisation to one or more polypeptide antigens. The method of the invention has immunomodulator activity, and may have a use in gene therapy. The composition and method are useful in manufacturing a medicament for desensitising an individual to a selected polypeptide antigen or for generating in the individual a state of hyporesponsiveness to the antigen to allow desensitisation to one or more polypeptide antigens. The present sequence is used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             allergen; plant; expansin; transgenic plant; plant growth regulant; gene therapy; cell wall; growth; flexibility; tissue mechanical strength.
                                                                                                                                                                                                                                     Desensitizing an individual to a selected polypeptide antigen comprises administering a composition containing polypeptide antigens in an amount that generates a state of hyporesponsiveness to the antigen to allow
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    61

The present invention describes an isolated nucleic acid molecule (I) comprising a polynuclectide or its conservatively modified variant having a sequence of 291 bp (SEQ ID NO:1 (S1), ADJ65065). Also described: (I) a recombinant expression cassette (II) comprising (II); (2) a vector (III) comprising (II); (4) a group 2/3 allergen encoding a polypeptide comprising (II); (4) a group 2/3 allergen encoding a polypeptide comprising (III); (4) a group 2/3 allergen encoding a polypeptide comprising (IV); (7) a method of modifying (6) an antibody that selectively binds to (IV); (7) a method of modifying (6) an antibody that selectively binds to (IV); (7) a method of modifying (6) an antibody that selectively binds to (IV); (7) a method of modifying (6) an antibody that selectively binds to (IV); (7) a method of modifying (6) an antibody that selectively binds to (IV); (7) a method of modifying collaborated polymetic (IV) and modifying (IV); (8) a method of modifically hybridises to SI under stringent conditions; (8) a method of collaborated polypeptide having expansin activity; (10) a transgenic plant cell comprising a nucleic acid that comprises SI; (11) a transgenic plant (12) producing a polypeptide having expansin activity, or a transgenic plant comprising an uncleic acid that comprises SI; (11) a transgenic plant comprising and (12) seeds of the plant described above, which carry the postesses expansin activity, or a transgenic plant described above, which carry the Conditions; and (12) seeds of the plant described above, which carry the DNA construct in their genome. (1) has plant growth regulant activity, and can be used in gene therapy. The composition and methods of the present invention can be used in altering plant collaborated and interest invention and methods of the present sequence represents an allergen, which may effect growth, flexibility and mechanical strength in tissues in which may effect growth, flexibility and mechanical strength in tissues.
New isolated nucleic acid molecules encoding polypeptides having expansin activity, useful for altering plant cell wall properties to effect growth, flexibility and mechanical strength in tissues in which they are
                                                                                                                                                                         Claim 6; SEQ ID NO 11; 73pp; English

The present invention describes an isolated muches and molecule (1) a sequence of 291 bp (SEQ ID No.1 (S1), ADJ65065). Also described: (1) a sequence of 291 bp (SEQ ID No.1 (S1), ADJ65065). Also described: (1) a comprising (1); (2) a vector (III) comprising any of the 12 sequences of 90-comprising and of 90-comprising any of the 12 sequences of 90-comprising in the 20-comprising any of 10); (1) a method of modifying cell walls in the tissues of a transgenic plant, comprising introducing into a plant an expression cassette comprising a promoter active in cells of plants operably linked to a group 2/3 allergen polymucleotide which specifically hybridises to S1 under stringent conditions; (8) a method for producing a polypeptide having expansin activity; (10) a transgenic plant comprising a nucleic acid that comprises S1; (11) a transgenic plant comprising an uncleic acid that comprises S1; (11) a transgenic plant comprising an activity, or a transgenic plant comprising an comprising a nucleic acid that comprises S1; (11) a transgenic plant comprising an uncleic acid that comprises S1; (11) a transgenic plant comprising an uncleic acid that comprises S1; (11) a transgenic plant comprising an uncleic acid that comprises S1; (11) a transgenic plant comprising an uncleic acid that comprises S1; (11) a transgenic plant comprising an uncleic acid that comprises S1; and that confined which specifically hybridises to S1 under stringent conditions; and (12) seeds of the plant described above, which can be used in gene therapy. The composition and methods of the present invention can be used in altering plant cell wall properties, which may effect growth, flexibility and method and methods are represented in which they are expressed in alter
                                                                                                                                                                        New isolated nucleic acid molecules encoding polypeptides having expansin activity, useful for altering plant cell wall properties to effect growth, flexibility and mechanical strength in tissues in which they are

The invention relates to a novel method for desensitising an individual to a selected polypeptide antigen. The method comprises administering a composition that contains polypeptide antigens in an amount that generates in the individual a state of hyporesponsiveness to the antigen of the invention has immunomodulator activity, and may have a use in gene therapy. The composition and method are useful in manufacturing a medicament for desensitising an individual to a selected polypeptide antigen or for generating in the individual a state of hyporesponsiveness to the antigen to allow desensitisation to one or more polypeptide antigens. The present sequence is used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Allergen; protein coordinate data; vaccine; antiallergic; immunogenicity; detergent; personal care composition; cosmetic.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  8
                                                                                                                                                                                                                                                                                                                                                                                                                                                     This invention describes a novel method of desensitizing a patient to a polypeptide allergen and comprises administering to the patient a peptide colypeptide allergen where restriction to a MHC Class II molecule possessed by the patient can be demonstrated for the peptide and the peptide is able to induce a late phase response in an individual who peptide is able to induce a late phase response in an individual who pessesses the MHC class II molecule. The methods can be used for desensitising patients to allergens present in e.g. grass, tree and weed (including ragweed) pollens, fungi and moulds, foods, stinging insects, the chiromidae (non-biting midges), spiders and mites, housefly, fruit if, sheep blow fly, serew worm fly, grain weevil, silkworm, honeybee, non-biting midge larvae, bee moth larvae, mealworm, cockroach, larvae of remibrio molitor beetle, mammals such as cat, dog, horse, cow, pig, sheep, rabbit, rat, guinea pig, mice or gerbil. They can also be used to produce immunological vaccines which may be used to prevent and/or treat conditions involving hypersensitivity to allergens. This sequence conditions and produce an element application of the patient patients a phleum sp. (Timothy grass) phl p 2 allergen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                9

Selecting protein variants having modified immunogenicity, used to produce vaccines, detergents and personal care compositions, involves localizing epitope sequences on the three-dimensional structure of a protein.

Claim 43; Page 486; 513pp; English.

The invention relates to selecting a protein variant having modified immunogenicity, compared to a parent protein, comprising using the antibody binding sequence to localise epitope sequences on the three dimensional structure of the parent protein and defining an epitope area including amino acids within 5 Angstrom of the epitope amino acids. The method is useful for identifying structural epitopes on the 3-dimensional surface of commercial and environmental allergens. Compositions containing the protein variants are used as vaccines, detergents and personal care compositions, e.g. shampoo, balsam, hair conditioners, hair waring compositions, hair dyeing compositions, hair dyeing compositions, hair tonic, hair liquid, hair cream, hair rinse, hair spray, chewing gum, skin cream, sunscreen, shaving foam, cream soap, skin milk or foundation. The present sequence is that of a polypeptide of the invention

Sequence 94 AA;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 4,

"Cloning, sequencing and immunological characterization of Dac g 3, major allergen from Dactylis glomerata pollen.";
Mol. Immunol. 33:797-806(1956).
-!- SUBCELIULAR LOCATION: Secreted.
-!- ALLERGEN: Causes an allergic reaction in human. Causes grass pollen allergy. Binds to 1gE.
-!- SIMILARITY: Belongs to the expansin family.
-!- SIMILARITY: Contains 1 expansin-like CBD domain.

"In Franction in supercolled DNA with palindromic sequence, indicating that it may promoce strand exchange reactions in homologous recombination. RuvAB is an helicase that mediates the Holliday junction migration by localized denaturation and reannealing (By similarity).

"In SIMILARITY: Belongs to the ruvB family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This Swiss-Prot entry is copyright. -!- FUNCTION: The ruvA-ruvB complex in the presence of ATP renatures cruciform structure in supercoiled DNA with palindromic sequence, indicating that it may promote strand exchange reactions in homologous recombination. RuvAB is an helicase that mediates the Holliday junction migration by localized denaturation and reannealing (By similarity).
-!- SUBUNIT: Forms a complex with ruvA (By similarity).
-!- SIMILARITY: Belongs to the ruvB family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         MUCLEOTIDE SEQUENCE [LARGE SCALE GENOMIC DNA].

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                      February 16, 2006, 11:57:35; Search time 3.58974 Seconds (without alignments) 79.196 Million cell updates/sec
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 45, A

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 9,

Patent No. 6451324
GENERAL INFORMATION:
GENERAL INFORMATION:
APPLICANT: Singh, Mohan Bir, Knox, Robert B., Smith, Penelope,
APPLICANT: Avjioglu, Asil, Theerakulpisht, Piyada, Hough, Terryn
TITLE OF INVENTION: Ryegrass Pollen Allergen
NUMBER OF SEQUENCES: 25
CORRESPONDENCE ADDRESS:
ADDRESSEE: Woodcock Washburn Kurtz Mackiewicz & No. 6451324ris
STREET: Philadelphia
STATE: PA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Length 31;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Indels
                                                                                                                                     COMPUTER: FLODEY GIBER
